

## THE PRODUCT AND ENGINEERING PROPOSITION

# RedShades. Intelligence with an operating system.

An 88-stage adaptive chain, custom capability generation, mid-run software repair and a native Qt workspace connect in one independently developed platform. RedShades combines deterministic orchestration with focused AI reasoning to carry complex security investigations across tools, branches and long-running sessions.

Actual Qt capture · 5 September 2026 · fictional, disconnected fixture. Presentation evidence only.

The central proposition is architectural: spend model capacity on interpretation and synthesis while software owns workflow, context, validation and execution policy. The 88 automatic declarations form a conditional graph; separate C2 stage families extend session work.

## Implemented contract

Reference 01

authoritative engagement architecture

## WHO DECIDES WHAT HAPPENS NEXT?

# A chain that schedules, branches and adapts

The scheduler evaluates 88 automatic stage declarations against current evidence. Independent branches advance when their inputs are ready; loops revisit useful frontiers as observations change. The Executive maintains the wider view while ACP supplies missing capabilities and AEP repairs the underlying software.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Each role has a distinct responsibility: scheduling, supervision, bounded interpretation, capability generation or platform repair. Their shared records let the investigation progress beyond one prompt or one tool.

## Implemented contract

Reference 02  
 subsystem glossary

## PARENT CONTEXT, CHILD SCOPE, CONNECTED PROGRESS

# Pivot into a child investigation

A newly available route can open a child subchain with its own scope and execution context. Parent and child retain their relationship, so a deeper investigation remains part of the same attributed engagement.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

Frontiers track eligible and waiting work. Branch-local decisions allow unrelated work to continue; parent completion accounts for attached investigations. This is a graph of evolving work rather than a fixed checklist.

**Implemented contract**

Reference 03

authoritative engagement architecture

## HOW AI ALLOCATION CONNECTS TO PRODUCT VALUE

# 70% deterministic. 30% neural.

RedShades uses this ratio as a design philosophy: dependable software surrounds the places where model judgment adds value. Scheduling, state, policy and validation provide structure; models interpret ambiguity, develop candidates and guide complex engineering work.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

The ratio is a design framing, not a measured code, runtime or success percentage. The intended economic advantage is selective intelligence: compact specialists for bounded decisions, persistent sessions for work that benefits from continuity.

## Design philosophy

Reference 04  
acp vertical session

## WHAT BELONGS TOGETHER?

# An engagement memory shared by every subsystem

Evidence, identities, routes, artifacts, capabilities and outcomes are linked in versioned engagement records. The scheduler, model workspaces and operator views can work from the same account of the investigation.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

Revision-bound records preserve the inputs behind each decision. Canonical state supplies the architecture for coordinated work across tools and sessions; source references document the implementation boundaries.

## Implemented contract

Reference 05

authoritative engagement architecture

## WHAT MAKES EVIDENCE REUSABLE?

# From tool output to reusable evidence

Integrated tools contribute observations with their source, context and interpretation retained. Source references make an accepted result useful to the next stage, the next model segment and the operator inspecting the decision.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

Evidence categories support correlation without flattening distinct candidates into one summary. This is the connection between broad tool coverage and coherent automated reasoning.

**Implemented contract**

Reference 06

canonical specialist contracts

## WHAT DOES THE STAGE COUNT DESCRIBE?

# 88 automatic stages, one adaptive graph

Discovery, service and identity analysis, web investigation, artifact analysis, session work and reporting are represented in 88 automatic stage declarations. A separate set of 13 C2 declarations adds common and platform-specific session families.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Prerequisites, evidence, platform selection and operator policy select the actual path. The stage atlas provides every automatic declaration with its source label and input/output role; 88 does not describe a mandatory linear execution sequence.

## Implemented contract

Reference 07

`semantic_registry.go + chain_runtime.go`

## HOW THE GRAPH AVOIDS INVENTING AUTHORITY

# A scheduler that understands relationships

The Execution Graph distinguishes scheduling dependencies from evidence correlations. Phase barriers, declared branch dependencies and scoped eligibility control work, while context and evidence links enrich the operator's view.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

The scheduler evaluates a bounded stage view. Dynamic endpoint and gate nodes remain useful to the operator without multiplying the work required to decide which stage is ready.

**Implemented contract**

Reference 08  
execution graph lifecycle

## HOW BRANCHES PROGRESS INDEPENDENTLY

# Keep independent branches moving

The scheduler separates branch-local gates from a global pause. A web review, identity question or pending prerequisite can wait in its own scope while other eligible work advances.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Loops and dormant branches respond to new evidence. The frontier records which input can change eligibility, giving long investigations a clear continuation point.

**Implemented contract**

Reference 09  
execution graph lifecycle

## WHAT SURROUNDS A DECISION?

# Small calls with complete jobs

Bounded stateless AI calls receive a defined purpose and a structured evidence packet. Core includes a bank of 100 fine-tuned specialist adapters for these focused calls and code-review roles. Deterministic code checks the response, attributes the model and retains accepted results.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Token accounting, capacity controls and response validation surround each call. Specialist selection follows the task boundary while the workspace retains its evidence and review history.

**Core model entitlement**

Reference 10  
commercial model specifications

WHAT IS THE EXECUTIVE WATCHING?

# An Executive that retains the wider mission

The Executive observes progress across stages, prioritizes attention and routes capability gaps or engineering incidents. Its persistent supervisory context complements the short, focused calls used inside individual boundaries.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Overview and detail crop from identical source pixels. Presentation evidence only.

Executive, ACP and AEP workspaces preserve artifacts and checkpoints for longer tasks. Model capacity can be allocated by responsibility, while the deterministic controller retains authority over the workflow.

Implemented contract

Reference 11  
executive teacher babysitter plan

## HOW COULD A COMPACT MODEL CONTRIBUTE?

# Persistent sessions for more complex work

Advanced includes a fine-tuned 30B3A Flash model for persistent higher-complexity sessions. Executive, ACP and AEP workspaces retain accepted artifacts, prior review and progress records between segments, supporting work that benefits from continuity.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

The model complements bounded specialist calls within the same orchestration architecture. Model and adapter weights are provided under NDA; active subscriptions receive weights and stage updates at least every six months.

**Advanced model entitlement**

Reference 12

commercial model specifications + canonical specialist contracts

## WHY PERSIST A GENERATION SESSION?

# ACP builds evidence-bound capabilities

The Adaptive Capability Pipeline develops custom capability candidates from observed evidence and source mechanics. A persistent workspace owns binding, SDK selection or extension, adapter generation, review and replica validation.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Compatible catalog artifacts and SDKs can skip generation segments. New work retains its contract and review history, connecting flexibility with reusable, reviewed artifacts.

## Implemented contract

Reference 13  
 acp vertical session

WHAT CROSSES THE GENERATION BOUNDARY?

# From an advisory to a reviewed candidate

ACP connects source findings and advisories with typed capability contracts, SDK extensions and reviewed adapters. Where a ready-made proof of concept is absent, the workbench can retain a candidate for controlled evaluation.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Overview and detail crop from identical source pixels. Presentation evidence only.

Candidate source, metadata and tests are published as a digest-bound set.  
Admission and isolated review establish the boundary between generated material and an approved artifact.

Implemented contract

Reference 14  
acp vertical session

## WHY ISOLATE THE CONTAMINATION REVIEWER?

# Review is built into capability production

An isolated reviewer evaluates the candidate against its contract and provenance. Counterfactuals test whether changed names, ordering and evidence still support the same capability, helping turn a one-off result into a reusable component.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

The reviewer uses a read-only packet and returns a typed verdict to admission. Generation, review and execution authority remain separately owned.

**Implemented contract**

Reference 15  
acp vertical session

## WHERE ACP ENDS AND AEP BEGINS

# AEP repairs software while the run is in flight

The Autonomic Engineering Plane owns diagnosis, a persistent repair session, scoped source changes, tests, build admission, hot replacement and verified hand-back. It addresses defects in the platform machinery while ACP addresses missing target interactions.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

The full repair transaction preserves the run's context through a provider replacement. Its acceptance is defined by validated hand-back, connecting software engineering work to continued execution.

## Implemented contract

Reference 16

executive teacher babysitter plan

## HOW DO SPECIALIST MODEL ROLES CONNECT?

# 100 fine-tuned specialist adapters

Core includes a bank of 100 fine-tuned specialist adapters supporting bounded stateless calls and code-review roles. Focused model work sits within the platform's evidence, workflow and response-validation boundaries.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Ultimate adds a proprietary multi-encoder neural representation suite for defensive and forensic workloads. These task-specific embedding and representation networks have multiple workload variants. They are separate from the language models used for stateless calls and persistent sessions.

**Commercial model entitlements**

Reference 17  
commercial model specifications

## WHAT DOES THE COMPOSITION KERNEL OWN?

# Hot replacement with continuity

The Runtime Composition Kernel publishes versioned providers and controls leases, rollback and cleanup. New work can adopt a replacement while existing work retains its implementation and engagement records.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

This is the runtime foundation beneath AEP hand-back. State remains outside replaceable behavior, giving repair a defined boundary rather than requiring a whole-workspace restart.

**Implemented contract**

Reference 18  
runtime composition kernel

## HOW IS STALE WORK REJECTED?

# Workers return results under a lease

Isolated stage workers receive immutable execution envelopes. Results are accepted only against the current artifact, input and generation lease. That prevents an old worker from publishing a plausible result after its authority has expired.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

In-process handlers and isolated workers have different replacement boundaries. The catalog describes the common principle without implying that every component can be replaced at any arbitrary instruction.

**Implemented contract**

Reference 19

hot swappable stage workers

WHAT DOES CLEANUP NEED TO KNOW?

# Context and resource budgets stay visible

Custom context management and token accounting track the cost of model work. Resource supervision retains ownership of worker processes, bounded output and cleanup, supporting long sessions without losing sight of their compute footprint.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Overview and detail crop from identical source pixels. Presentation evidence only.

Token and resource diagnostics make unusual consumption inspectable. Named owners and retained cleanup handles let the platform distinguish active work from stale work.

Implemented supervision boundaries

Reference 20  
service process custody

## HOW THE WORKSPACE FITS TOGETHER

# Qt, watchdog and tools in one workspace

The native Qt operator places dense graphs and investigation panels inside a managed desktop workspace. The watchdog hosts retained service and tool surfaces, connecting Gitea, BloodHound, build workflows, RDP and development harnesses with the operator environment.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

Lightweight QML chrome surrounds native widgets. Embedded tool windows and custom analysis views can sit alongside each other, preserving tool fidelity while keeping the investigation visible.

## Implemented contract

Reference 21

subsystem glossary

## WHAT MAKES A TOOL CATALOG MORE THAN A LIST?

# Third-party tools, isolated execution

Tool descriptors connect network, web, directory, browser and source-inspection families to the platform. Admitted third-party proof-of-concept work can use isolated container environments, with outputs returned as attributed evidence.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Integration combines execution policy, process ownership and evidence normalization. Tool availability, candidate review and permission remain distinct inputs to the workflow.

**Implemented contract**

Reference 22  
specialist plugin registry

WHAT BINDS A BINARY TO ITS USE?

# VM-based transformation and artifact engineering

The artifact and implant toolchain includes transformation and obfuscation work alongside versioned builds. VM-oriented transformation is part of the project’s engineering breadth, with artifact identity and provenance carried into the wider workspace.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

The publication describes these systems at component level. Build records identify the material and its role; native artifact surfaces keep the resulting inventory accessible to the operator.

Implemented contract

Reference 23  
deployment and process ownership

## HOW IS POST-FOOTHOLD WORK REPRESENTED?

# Session work extends the investigation

C2 stage families add platform-aware continuation once a session is registered. Context, artifacts and attached work remain connected to the parent engagement, extending the same orchestration model beyond initial observation.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Common and Windows/Linux declarations preserve their own prerequisites. The automatic stage atlas and the C2 declaration inventory describe separate parts of the runtime graph.

**Implemented contract**

Reference 24

authoritative engagement architecture

EMBEDDED SPECIALIST TOOLS AND CUSTOM ANALYSIS

# Reverse engineering inside the workflow

Binary and source analysis connect to the investigation workbench and embedded specialist tools. Custom reverse-engineering workflows can sit beside native evidence views and retained external tool surfaces.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Overview and detail crop from identical source pixels. Presentation evidence only.

The integrated workspace brings analysis, artifact records and engineering context together. Tool-specific interfaces remain available while their results feed the shared investigation record.

Implemented contract

Reference 25

execution graph lifecycle

## WHAT SHOULD AN OPERATOR BE ABLE TO EXPLAIN?

# A working desktop for the whole investigation

Network Graph, WebRecon, Investigation Graph, session records and model controls share a native Qt operator. Embedded tools extend the workspace rather than forcing every workflow into a generic dashboard.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

The retained screenshots show real Qt widgets with fictional disconnected data. Their arrangement demonstrates how overview, selected evidence and specialist work can remain visible together.

## Sanitized native UI evidence

Reference 26

subsystem glossary

## NETWORK GRAPH

# Read the investigation spatially

The Network Graph presents observed hosts and relationships spatially. Its value is orientation: which context is selected and how that context relates to the wider investigation.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

Native Qt capture with fictional, disconnected demonstration data. The web edition opens the original image at full resolution.

**Sanitized native UI evidence**

Reference 27

subsystem glossary

## WEBRECON OVERVIEW

# Keep the source near the decision

WebRecon brings web observations, source detail and endpoint review into a native workspace. A useful arrangement lets the operator retain overview while examining the evidence behind one selected item.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

Native Qt capture with fictional, disconnected demonstration data. The web edition opens the original image at full resolution.

**Sanitized native UI evidence**

Reference 28

canonical specialist contracts

WEBRECON REVIEW AND GATE STATE

# A pending decision has a scope

A gate should explain the affected endpoint or branch and retain the evidence needed for a decision. The rest of the run should not appear globally blocked unless it was explicitly paused.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Overview and detail crop from identical source pixels. Presentation evidence only.

Native Qt capture with fictional, disconnected demonstration data. The web edition opens the original image at full resolution.

Sanitized native UI evidence

Reference 29

execution graph lifecycle

## INVESTIGATION GRAPH

# Reasoning needs inspectable sources

Investigation Graph organizes relationships among observations and interpretations. Its companion detail views preserve source references so the operator can inspect the basis of a hypothesis.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

Native Qt capture with fictional, disconnected demonstration data. The web edition opens the original image at full resolution.

## Sanitized native UI evidence

Reference 30

investigation attention

INVESTIGATION WORKBENCH

# The detail view carries the difficult questions

The Workbench provides a more deliberate place to inspect evidence, context and available continuation. Dense records benefit from selection and detail rather than forcing every field into the graph itself.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Overview and detail crop from identical source pixels. Presentation evidence only.

Native Qt capture with fictional, disconnected demonstration data. The web edition opens the original image at full resolution.

Sanitized native UI evidence

Reference 31  
canonical specialist contracts

## SESSION AND ARTIFACT SURFACES

# Sessions and artifacts at a glance

Session and agent views bring stored records, versioned builds and observed availability into the operator workspace. Selected detail connects the inventory with its context and current state.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

Native Qt capture with fictional, disconnected demonstration data. The web edition opens the original image at full resolution.

**Sanitized native UI evidence**

## HOW SHOULD CONFIDENCE ACCUMULATE?

# Verification at every scale

Focused contracts, integrated simulations, race checks, repetition, fuzzing and fault injection exercise different dimensions of the platform. Mega and Ultra organize these into explicit engineering acceptance work.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Revision-bound records connect each check to its command and output. Validation status is documented separately from the product's architectural capabilities.

**Implemented contract**

Reference 34  
ultra ci requirements

## WHAT DID THE DISCLOSURE STUDY MEASURE?

# Disclosures become a reusable methodology vocabulary

The Trigger Methodology Graph study organized 200 public disclosures into 37 recurring families. In a 40-disclosure identity-disjoint holdout, 39 belonged to a family represented in that vocabulary.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

This is family coverage in a curated study, not a count of executed discoveries. It motivates evidence-bound hypotheses and controlled follow-up through the diagnostic graph.

**Retained study**

Reference 35  
tmg disclosure generalization study

## HOW DO TMG AND SCG CONTRIBUTE?

# A hypothesis should reveal its missing evidence

Trigger Methodology Graph (TMG) produces evidence-bound diagnostic hypotheses. Shadow Capability Graph (SCG) reasons about missing prerequisites from an immutable snapshot. Bounty Hunting Gates (BHG) retain policy review for proposed hypotheses.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Their useful role is to make uncertainty and the next required evidence explicit. A diagnostic graph does not become scheduling or execution authority simply because its suggestion is plausible.

## Implemented contract

Reference 36

trigger methodology graph + shadow capability graph

## WHAT HAS BEEN REPORTED?

# Autonomous outcomes across Windows and web labs

The developer reports unattended completion of P.O.O, a hard Windows CTF, an insane Windows HTB lab and roughly two easy Linux/web HTB labs. These outcomes reflect the project's ambition to carry substantial work across an entire engagement.

Source-derived conceptual diagram. Arrows describe the labeled relationship.

Results are owner-reported autonomous outcomes. Independent complete log bundles were not established by this editorial review; the reported runs are not presented as a benchmark for every unseen environment.

**Developer-reported autonomous outcomes**

Reference 37

design history

AN INVITATION TO EXAMINE THE BOUNDARIES

# Explore the system in a private demonstration

RedShades brings adaptive orchestration, custom capability engineering, runtime repair and a native tool workspace into one product architecture. The investment proposition is the combination: a platform built to make focused model intelligence useful across substantial technical work.

Actual Qt capture - 5 September 2026 - fictional, disconnected fixture. Presentation evidence only.

A private technical demonstration can examine the operator, follow a retained capability through review and explore the engineering behind persistent sessions and hot replacement. Independent technology, presented for technical investors and product leaders.

Technical portfolio

## UNDER TESTING

# Specialist application domains

## Android / mobile

8 stages

### Under testing

**Entry evidence**

Application and device evidence

**Conditional branches**

Package, permission and storage branches

**Capabilities**

Mobile configuration, application metadata and transport review

**Shared tool architecture**

10 referenced entries · Androguard, Apktool, Android bundletool, Cosign, JADX, Mobile Security Framework. Native evidence and reporting components complete the cluster.

**Gate & convergence**

Scope and evidence checks select eligible analysis. Findings converge into an attributed domain report; missing inputs keep dependent work pending.

## Apple platforms

8 stages

### Under testing

**Entry evidence**

iOS, iPhone and macOS evidence

**Conditional branches**

Application, entitlement and platform branches

**Capabilities**

Signing, entitlements, privacy settings and platform configuration

**Shared tool architecture**

8 referenced entries · ipsw, LLVM binary utilities, Apple codesign/security toolchain. Native evidence and reporting components complete the cluster.

**Gate & convergence**

Scope and evidence checks select eligible analysis. Findings converge into an attributed domain report; missing inputs keep dependent work pending.

## Blockchain

8 stages

### Under testing

**Entry evidence**

Contract and transaction evidence

**Conditional branches**

Contract, dependency and governance branches

**Capabilities**

Contract metadata, access controls and transaction provenance

**Shared tool architecture**

8 referenced entries · Cosign, Echidna, Foundry, Slither, Solidity compiler. Native evidence and reporting components complete the cluster.

**Gate & convergence**

Scope and evidence checks select eligible analysis. Findings converge into an attributed domain report; missing inputs keep dependent work pending.

Core: 88 stages · Advanced: 78 additional stages · Ultimate: 17 additional stages.

**Under testing**

## UNDER TESTING

# Connected and intelligent systems

## Proximity / BLE / NFC

7 stages

### Under testing

**Entry evidence**

Captured proximity observations

**Conditional branches**

Protocol and device-class branches

**Capabilities**

Advertisement, pairing and NFC record analysis

**Shared tool architecture**

8 referenced entries · BlueZ btmon, libnfc utilities, Wireshark/TShark, Zeek. Native evidence and reporting components complete the cluster.

**Gate & convergence**

Scope and evidence checks select eligible analysis. Findings converge into an attributed domain report; missing inputs keep dependent work pending.

## Wi-Fi / RF

8 stages

### Under testing

**Entry evidence**

Wireless configuration and recorded traffic

**Conditional branches**

Network, radio and authentication branches

**Capabilities**

Wireless posture, spectrum records and authentication configuration

**Shared tool architecture**

9 referenced entries · GNU Radio, Suricata, Wireshark/TShark, Zeek. Native evidence and reporting components complete the cluster.

**Gate & convergence**

Scope and evidence checks select eligible analysis. Findings converge into an attributed domain report; missing inputs keep dependent work pending.

## LLM / AI systems

8 stages

### Under testing

**Entry evidence**

Model, application and evaluation evidence

**Conditional branches**

Data, model and application boundary branches

**Capabilities**

Evaluation artifacts, data handling and permission boundaries

**Shared tool architecture**

10 referenced entries · garak, Inspect AI, OSV-Scanner, Syft, Trivy. Native evidence and reporting components complete the cluster.

**Gate & convergence**

Scope and evidence checks select eligible analysis. Findings converge into an attributed domain report; missing inputs keep dependent work pending.

Core: 88 stages · Advanced: 78 additional stages · Ultimate: 17 additional stages.

**Under testing**

UNDER TESTING

# Infrastructure at the edge

## Satellite / space

7 stages

Under testing

Entry evidence

Ground-system and telemetry artifacts

Conditional branches

Ground, link and telemetry branches

Capabilities

Telemetry formats, asset configuration and trust boundaries

Shared tool architecture

10 referenced entries · GNU Radio, gr-satellites, Orekit, Wireshark/TShark, Zeek. Native evidence and reporting components complete the cluster.

Gate & convergence

Scope and evidence checks select eligible analysis. Findings converge into an attributed domain report; missing inputs keep dependent work pending.

## Quantum readiness

6 stages

Under testing

Entry evidence

Cryptographic asset inventory

Conditional branches

Algorithm, dependency and migration branches

Capabilities

Cryptographic discovery and migration readiness analysis

Shared tool architecture

6 referenced entries · Cirq, Qiskit SDK. Native evidence and reporting components complete the cluster.

Gate & convergence

Scope and evidence checks select eligible analysis. Findings converge into an attributed domain report; missing inputs keep dependent work pending.

Core: 88 stages · Advanced: 78 additional stages · Ultimate: 17 additional stages.

Under testing

UNDER TESTING

# Physical and industrial systems

## Hardware / firmware

9 stages

Under testing

**Entry evidence**

Firmware images and component inventory

**Conditional branches**

Image, component and boot-policy branches

**Capabilities**

Firmware metadata, component provenance and secure-boot posture

**Shared tool architecture**

11 referenced entries · Binwalk, Cosign, Ghidra, ipsw, LLVM binary utilities, QEMU, Syft, Trivy. Native evidence and reporting components complete the cluster.

**Gate & convergence**

Scope and evidence checks select eligible analysis. Findings converge into an attributed domain report; missing inputs keep dependent work pending.

## ICS / SCADA

9 stages

Under testing

**Entry evidence**

Industrial asset and configuration evidence

**Conditional branches**

Asset, protocol and zone branches

**Capabilities**

Configuration review, protocol records and segmentation posture

**Shared tool architecture**

11 referenced entries · OpenSCAP, QEMU, Suricata, Wireshark/TShark, Zeek. Native evidence and reporting components complete the cluster.

**Gate & convergence**

Scope and evidence checks select eligible analysis. Findings converge into an attributed domain report; missing inputs keep dependent work pending.

Core: 88 stages · Advanced: 78 additional stages · Ultimate: 17 additional stages.

Under testing

## UNDER DEVELOPMENT

# PurpleShades and digital forensics

## PurpleShades • Defensive patching

8 stages • **Under development**

Asset and finding intake opens parallel exposure, dependency and remediation analysis. A change plan brings the branches together with rollback criteria, canary observations and approval requirements.

Advisories → assessment branches → change proposal → rollback / canary criteria → approval → review packet

The workflow assembles a reviewed proposal and defines the evidence required to validate a future change.

## Digital forensics

9 stages • **Under development**

Case intake establishes evidence identity and custody. Artifact, timeline and correlation branches preserve source attribution and converge into a reviewable case record.

Case intake → evidence preservation → analysis branches → correlation → review → case report

Integrity checks precede analysis. Incomplete or conflicting observations remain visible in the final evidence account.

Core: 88 stages • Advanced: 78 additional stages • Ultimate: 17 additional stages.

**Under development**

## ANNUAL PRICING PER SEAT

# Three bundles. One connected practice.

## Core

Starting at

**\$7,000**

/ year per seat

88 Core stages

**Validated Core**

100 fine-tuned specialist adapters for bounded stateless calls and code-review roles.

## Advanced

Starting at

**\$14,000**

/ year per seat

Core + 78 specialist stages

**Under testing**

Fine-tuned 30B3A Flash model for persistent higher-complexity sessions.

## Ultimate

Starting at

**\$20,000**

/ year per seat

Advanced + 17 defensive and forensic stages

**Under development**

Proprietary multi-encoder neural representation suite for defensive and forensic workloads, with multiple task-specific embedding and representation variants.

Model and adapter weights are provided under NDA. Active subscriptions receive weights and stage updates at least every six months.

183 stages in total. Separate C2 session declarations are counted independently.

Core: 88 stages · Advanced: 78 additional stages · Ultimate: 17 additional stages.

Annual pricing per seat
